Cubic Splines

- For a set of data points $D = \{(x_i, y_i) | i = 0, \dots, N\}$

$$S_i(x) = a_i x^3 + b_i x^2 + c_i x + d_i$$

- There are N segments, $4N$ unknown parameters

Interpolation condition: $S_i(x_i) = y_i$, $S_i(x_{i+1}) = y_{i+1}$

No local control: Every data point affects the entire curve

Computationally expensive: Need to solve very large linear system when N is big

Boundary condition: $S_0'(x_0) = y_0'$, $S_{n-1}'(x_n) = y_{n-1}'$
